# Aldehydes, Ketones and Carboxylic Acids

## CHAPTER 12

## **ANSWERS**

1. (c): 
$$\begin{array}{c} H_{3}C \longrightarrow C \implies 0 \xrightarrow{\Delta} CH_{2} \implies C \implies 0 \\ H - CH_{2} & \xrightarrow{EtOH} CH_{3} - C \implies 0 \\ \hline \end{array}$$

EXAM DRILL

> OEt Ethyl acetate (B)

**3.** (a) : Addition of HCN to carbonyl compounds is nucleophilic addition reaction. The order of reactivity of carbonyl compounds is,

 $HCHO > CH_3COCH_3 > PhCOCH_3 > PhCOPh.$ 

#### 4. (b)

5. (a) :  $CH_3CHO$  is most reactive towards nucleophilic addition reactions. Carbonyl compounds are polar with positive charge on carbon atom which is attacked by nucleophiles. Two electron releasing alkyl groups in ketones make carbon less electron deficient than aldehydes. Benzene ring exhibits +*R*-effect which thereby decreases the ease of nucleophilic addition reaction in benzaldehyde and acetophenone. Hence the reactivity order is

$$\begin{array}{c} H & \delta + & \delta - & H & \delta + & \delta - \\ > C = 0 > & C = 0 \\ H & R & R \end{array} C = 0 > & C = 0 \\ \end{array}$$

- **6.** *p*,*p*-Dihydroxybenzophenone
- 7. Wolff-Kishner reduction
- 8. Ethanoic anhydride
- 9. Acetamide
- **10.** Ethyl benzoate

#### OR

$$CH_3CH_2CH_3 < CH_3OCH_3 < CH_3CHO < CH_3CH_2OH$$

### 11. (b)

14. (b)

**12.** (c) : Carboxyl group being an electron withdrawing group only decreases the electron density at *o*- and *p*-position so, at *m*-position electron density is comparitively higher.

**13.** (c) : Aromatic carboxylic acids do not undergo Friedel-Crafts reaction, because the carboxyl group is deactivating and the catalyst aluminium chloride (Lewis acid) gets bonded to the carboxyl group.

#### OR

(c) : Aromatic aldehydes and formaldehyde do not contain  $\alpha$ -hydrogen and thus undergo cannizzaro reaction. Formaldehyde is more reactive than aromatic aldehydes.

15. (i) 
$$CH_{3}CHO \xrightarrow{HCHO} CH_{2} = CH - CHO \xrightarrow{HCN}_{H^{+}}$$
  
Ethanal  $OH \\ CH_{2} = CH - CH - COOH \\ 2-Hydroxy-3-butenoic acid \\ (ii) HCHO \xrightarrow{CH_{3}MgBr}_{H^{+}} CH_{3}CH_{2}OH \xrightarrow{PCI_{5}} CH_{3}CH_{2}CI \\ Methanal \xrightarrow{H^{+}}_{H^{+}} CH_{3}CH_{2}OH \xrightarrow{PCI_{5}}_{H^{2}CH_{2}CH_{2}CH_{3}}$   
 $Na \\ dry ether \xrightarrow{CH_{3}CH_{2}CH_{2}CH_{3}}$ 

**16.** The compound has two side chains on the benzene ring at adjacent position. As it gives positive Tollens' test, it indicates the presence of –CHO but without  $\alpha$ -hydrogen (because it gives +ve Cannizzaro reaction). The structure of the compound

18. (i) 
$$CH_{3}(CH_{2})_{4}CH = CH_{2} \xrightarrow{O_{3}} CH_{3}(CH_{2})_{4}CHO + HCHO Hexanal}$$
  
(ii)  $CH_{3}(CH_{2})_{4}CH = CH_{2} \xrightarrow{B_{2}H_{6}} CH_{3}(CH_{2})_{4}CH_{2}CH_{2}OH + HcHO Hexanal}$   
(ii)  $CH_{3}(CH_{2})_{4}CH = CH_{2} \xrightarrow{B_{2}H_{6}} CH_{3}(CH_{2})_{4}CH_{2}CH_{2}OH + \frac{H_{2}SO_{4}}{KMnO_{4}} CH_{3}(CH_{2})_{4}CH_{2}COOH + HcHO Heptanoic acid$   
19. (i)  $O = C - OH + 4[H] \xrightarrow{LiAIH_{4}} Benzoic acid OH + 4[H] \xrightarrow{CH_{2}OH} CH_{2}OH + H_{2}O Benzyl alcohol$   
(ii)  $O = CH_{2}OH \xrightarrow{Na_{2}Cr_{2}O_{7}} OH + 4[H] \xrightarrow{O} CH_{2}OH + H_{2}O Benzyl alcohol}$ 

20. Clemmensen reduction :

$$>C = 0 \xrightarrow{Zn-Hg} > CH_2 + H_20$$

Wolff-Kishner reduction :

.

$$c = 0 \xrightarrow{\text{NH}_2\text{NH}_2} c = \text{NNH}_2$$

$$c = \text{NNH}_2 c = \text{NNH}_2$$

### OR

$$2CH_{3} - CO - CH_{3} \xrightarrow{Ba(OH)_{2}}$$
Propanone
$$CH_{3} - CH_{3} = CH_{2} - CH_{3} \xrightarrow{O}_{-H_{2}OH}$$

$$CH_{3} - CH_{2} - CH_{3} \xrightarrow{A}_{-H_{2}OH}$$

4-Hydroxy-4-methylpentan-2-one

$$CH_3$$
  
 $I$   
 $CH_3 - C = CHCO - CH_3$   
 $4$ -Methylpent-3-en-2-one

**21.** (a) *R*COOH dissolves in water because –COOH of *R*COOH can form H-bonds with water in two ways :

The -R group is non-polar and hydrophobic and this effect dominates when R posseses more than five carbon atoms.

Thereby decreasing its solubility in more polar solvent (as water) but the solubility in less polar solvent such as alcohol increases.

MtG100PERCENT Chemistry Class-12

(b) This is due to the presence of H-bonding.

$$R = C \xrightarrow{\begin{array}{c} \delta_{+} & \delta_{+} \\ 0 & \cdots & H \end{array}}_{\begin{array}{c} 0 & \cdots & H \end{array}} \xrightarrow{\begin{array}{c} \delta_{+} & \delta_{-} \\ 0 & \cdots & 0 \end{array}} C = R$$

**22.** 2, 5-Dimethylhexan-3-one is an unsymmetrical ketone, thus oxidation occurs on either side of C = 0 group.

$$\begin{array}{c} CH_{3} & O & CH_{3} \\ I & II \\ CH_{3}-CH + CH_{2}-CH_{2}-CH_{3}-CH_{3} \\ 2,5-Dimethylhexan-3-one \\ CH_{3} \\ CH_{3}-CH-COOH + \\ 2-Methylpropanoic acid \\ CH_{3} \\ \end{array}$$

Propan-2-one on further oxidation yields a mixture of ethanoic acid and methanoic acid.

$$CH_3 - C - CH_3 \xrightarrow{[0]} CH_3 - C - OH + HCOOH$$
  
Propan-2-one Ethanoic acid Methanoic acid

Methanoic acid on further oxidation gives  $CO_2$  and  $H_2O$ .

$$HCOOH \xrightarrow{[0]} CO_{2} + H_{2}O$$

- 23. (a) 1-Phenylpentane-2,3-dione
- (b) 4-Oxocyclohexane-1-carboxylic acid
- (c) Hexane-2,4-dione

#### OR

**25.** (a) Cannizzaro reaction is given by aldehydes without  $\alpha$ -hydrogen. Aldehydes which do not have  $\alpha$ -hydrogen in the presence of conc. alkali undergo self redox reaction. One aldehyde gets oxidised to form salt of a carboxylic acid and other aldehyde gets reduced to form 1° alcohol.

Example : 2HCHO 
$$\xrightarrow{\text{Conc. NaOH}}$$
 CH<sub>3</sub>OH + HCOONa<sup>+</sup>

This reaction is also called a disproportionation reaction.

(b) 
$$CH_3CH_2CH=CH-CHO \xrightarrow{Zn/Hg}{HCI} CH_3CH_2CH=CH-CH_3$$

**26.** Propanal and 2-methylpropanal both have  $\alpha$ -hydrogen atom, thus, these undergo cross-aldol condensation in which each one of them can act either as an electrophile or a nucleophile. Thus,

(i) 
$$CH_{3} CH_{2} - CH_{3} -$$

trimethylpentanal **27.** (a) The reaction of carbonyl group with  $H_2N-Z$  is an acid catalysed reaction.

3-Hydroxy-2,2,4

CH,

$$>c = 0 \xrightarrow{H^+} \xrightarrow{F^+} 0H \xrightarrow{H_2N-Z} \xrightarrow{OH} \xrightarrow{H_2N-Z} \xrightarrow{H^+-Z} \xrightarrow{H^+Z} \xrightarrow{H^+-Z} \xrightarrow{H^+Z} \xrightarrow{Z} \xrightarrow{Z} \xrightarrow{Z} \xrightarrow{Z} \xrightarrow{Z} \xrightarrow{Z}$$

#### MtG100PERCENT Chemistry Class-12

**28.** (a) We remove aldehydes as soon as it is formed thus preventing its further oxidation to carboxylic acid.

(b) 
$$2 CH_3 - C = 0 \xrightarrow{\text{Dil.Ba}(OH)_2} CH_3 - C = CH_2COCH_3$$
  
 $(B_1 - CH_3 - C - CH_2COCH_3 - CH_3 - CH_3$ 

(c) (i) 2-Chloro-4-oxohexanal (ii) 4-Hydroxy-2-oxohexane-1,6-dial

....

**29.** (a) (i) 
$$(CH_3)_2CHCOOH < CH_3CH_2CH_2COOH < CH_3CHCH_2COOH < CH_3CH_2CHCOOH 
 $H_1$   
Br Br Br$$

(ii) 4-Methoxybenzoic acid < benzoic acid < 4-nitrobenzoic acid < 3,4-dinitrobenzoic acid

(iii) Benzoic acid < 2-methylbenzoic acid < 3-nitrobenzoic acid < 2,4-dinitrobenzoic acid

	H <sub>2</sub> N-O-COOH
Benzamide	<i>p</i> -Aminobenzoic acid
No brisk effervescence	It gives brisk effervescence

(ii) Test - Hydrolysis in acid followed by I<sub>2</sub>/NaOH

#### OR

- (a) All four isomers contain -COOH group as they evolve
- $CO_2$  on reaction with aqueous NaHCO<sub>3</sub>.

$$\begin{array}{c} \mathsf{CH}_{3} - \overset{*}{\mathsf{CH}} - \mathsf{COOH} & \mathsf{CH}_{3} - \overset{*}{\mathsf{CH}} - \mathsf{CH}_{2}\mathsf{COOH} \\ & \mathsf{I} & \mathsf{I} \\ \mathsf{CH}_{2}\mathsf{OH} & \mathsf{OH} \\ & (1) & (2) \\ 3-\mathsf{Hydroxy-2-methyl} \\ \mathsf{propanoic acid} & 3-\mathsf{Hydroxybutanoic acid} \\ \\ \\ \mathsf{CH}_{3} - \mathsf{CH}_{2}\overset{*}{\mathsf{CHCOOH}} & \mathsf{CH}_{3}\overset{*}{\mathsf{CHCOOH}} \\ & \mathsf{I} \\ & \mathsf{OH} & \mathsf{OCH}_{3} \\ & (3) & (4) \\ \\ \mathbf{2}-\mathsf{Hydroxybutanoic acid} & 2-\mathsf{Methoxypropanoic acid} \end{array}$$

(b) LiAlH<sub>4</sub> converts –COOH to –CH<sub>2</sub>OH. Only (1) is reduced to an achiral product.

$$\begin{array}{c} \mathsf{CH}_{3} \longrightarrow \mathsf{CH} \longrightarrow \mathsf{COOH} \xrightarrow{\mathsf{LiAlH}_{4}} & \mathsf{CH}_{3} \longrightarrow \mathsf{CH} \longrightarrow \mathsf{CH}_{2}\mathsf{OH} \\ & \mathsf{CH}_{2}\mathsf{OH} & \mathsf{CH}_{2}\mathsf{OH} \\ & (\mathsf{Chiral}) & (\mathsf{Achiral product}) \end{array}$$

(c) The ether (4) differs from (2) and (3), in that it is inert to oxidation by  $KMnO_4$ , hence does not decolourise  $KMnO_4$ . (2) gives a positive iodoform test and iodoform test can be used to distinguish (2) from (3).

**30.** (i) 120°

(ii) 
$$\bigcirc$$
 -CHO + H<sub>2</sub>N-OH  $\xrightarrow{pH = 3.5}$   
 $\bigcirc$  -CH=N-OH  
(Benzaldehyde oxime)  
(iii) CH<sub>3</sub>-C-CH<sub>3</sub> + HCN  $\longrightarrow$   $\xrightarrow{CH_3}_{CH_3}$  -COH  
(Actone cyanohydrin)

Aldehydes, Ketones and Carboxylic Acids

(iv) 
$$CH_{3}CH=0 + H_{2}N-NH-C-NH_{2}$$
  
 $O$   
 $CH_{3}-CH=NNH-C-NH_{2}$   
 $CH_{3}-CH=NNH-C-NH_{2}$   
 $CH_{3}-CH=NNH-C-NH_{2}$   
 $CH_{3}-CH=C-NH_{2}$   
 $CH_{3}-C-NH_{2}$   
 $CH_{3}-C-NH_{2$
