## Surface Areas and Volumes

## SOLUTIONS

**1.** (a) : The shape of Surahi is as

, which is combination of sphere and cylinder.

2. (b) : Let the radius of the cone be r cm.

**Since**, the height and diameter of the base of the largest right circular cone = Edge of the cube.

$$\therefore \quad 2r = 8 \text{ cm} \implies r = 4 \text{ cm}$$

- = Cone + Cylinder + Cone
- = Two cones and a cylinder

**4.** (**b**) : Because the sphere is enclosed in the cylinder, therefore the diameter of sphere is equal to the diameter of cylinder which is 2*r* cm.

5. (a) : Area of canvas required = Curved surface area of cylinder + Curved surface area of cone =  $2\pi rh + \pi rl$ 

$$= \pi r[2h+l] = \frac{22}{7} \times \frac{98}{2} [2 \times 4 + 30]$$
  
= 5852 m<sup>2</sup>

6. When, we join two solid hemispheres along their bases of radius *r*, we get a solid sphere. Also, curved surface area of a hemisphere is  $2\pi r^2$ .

Hence, the curved surface area of new solid =  $2\pi r^2 + 2\pi r^2$ =  $4\pi r^2$ .

7. Because solid ball is exactly fitted inside the cubical box of side *a*. So, *a* is the diameter of the solid ball.

$$\therefore \text{ Radius of the ball} = \frac{a}{2} \qquad [\because \text{ diameter} = 2 \times \text{ radius}]$$
  
So, volume of the ball =  $\frac{4}{3}\pi \left(\frac{a}{2}\right)^3 = \frac{1}{6}\pi a^3$ 

8. (i) Lateral surface area of *Hermika* which is cubical in shape =  $4a^2 = 4 \times (8)^2 = 256 \text{ m}^2$ 

(ii) Diameter of cylindrical base = 42 m

:. Radius of cylindrical base (r) = 21 m Height of cylindrical base (h) = 12 m

...

Number of bricks used = 
$$\frac{\frac{22}{7} \times 21 \times 21 \times 12}{0.01}$$

## = 1663200

(iii) Given, diameter of *Anda* which is hemispherical in shape = 42 m

 $\Rightarrow$  Radius of Anda (r) = 21 m

:. Volume of Anda = 
$$\frac{2}{3}\pi r^3 = \frac{2}{3} \times \frac{22}{7} \times 21 \times 21 \times 21$$
  
= 44 × 21 × 21 = 19404 m<sup>3</sup>

- (iv) Given, radius of *Pradakshina* Path (r) = 25 m
- $\therefore$  Perimeter of *path* =  $2\pi r$

$$=\left(2\times\frac{22}{7}\times25\right)$$
m

: Distance covered by priest =  $14 \times 2 \times \frac{22}{7} \times 25$ = 2200 m

(v) :: Radius of *Anda* (r) = 21 m :. Curved surface area of *Anda* =  $2\pi r^2$ 

$$= 2 \times \frac{22}{7} \times 21 \times 21 = 2772 \text{ m}^2$$

. We have, radius of each coin = 3.5 cm

$$=\frac{35}{10}$$
 cm  $=\frac{7}{2}$  cm

Thickness of each coin =  $0.5 \text{ cm} = \frac{1}{2} \text{ cm}$ 

So, height of cylinder made by Meera( $h_1$ ) = 12 ×  $\frac{1}{2}$  = 6 cm

and height of cylinder made by Dhara  $(h_2)$ 

$$=8\times\frac{1}{2}=4$$
 cm

(i) (b) : Curved surface area of cylinder made by Meera =  $2 \times \frac{22}{7} \times \frac{7}{2} \times 6 = 132 \text{ cm}^2$ 

(ii) (b): Required ratio

Curved surface area of cylinder made by Meera Curved surface area of cylinder made by Dhara

$$=\frac{2\pi rh_1}{2\pi rh_2}=\frac{h_1}{h_2}=\frac{6}{4}=\frac{3}{2} i.e., 3:2$$

(iii) (a) : Volume of cylinder made by Dhara =  $\pi r^2 h_2$ 

$$=\frac{22}{7}\times\frac{7}{2}\times\frac{7}{2}\times\frac{7}{2}\times4=154$$
 cm<sup>3</sup>

$$30 \text{ m}$$
  
 $4 \text{ m}$ 

() + () >

(iv) (c) : Required ratio

$$= \frac{\text{Volume of cylinder made by Meera}}{\text{Volume of cylinder made by Dhara}}$$
$$= \frac{\pi r^2 h_1}{\pi r^2 h_2} = \frac{h_1}{h_2} = \frac{6}{4} = \frac{3}{2} \text{ i.e., } 3:2$$

(v) (a) : When two coins are shifted from Meera's cylinder to Dhara's cylinder, then length of both cylinders become equal.

So, volume of both cylinders become equal.

**10.** (i) (c): Required area of canvas = Curved surface area of cone + Curved surface area of cylinder

$$= \pi r l + 2\pi r h = \pi r (l + 2h)$$

$$= \frac{22}{7} \times 21 (29 + 44) = 4818 \text{ m}^{2}$$

$$\left[ \because l = \sqrt{r^{2} + h_{1}^{2}} = \sqrt{(21)^{2} + (20)^{2}} \\ = \sqrt{841} = 29 \text{ m} \right]$$

(ii) (b): Area of floor =  $\pi r^2$ 

$$=\frac{22}{7} \times 21 \times 21 = 1386 \text{ m}^2$$

Number of persons that can be accommodated in the tent =  $\frac{1386}{1000} = 11$ 

tent = 
$$\frac{126}{126}$$
 = 12

(iii) (d): Since, cost of 100 m<sup>2</sup> of canvas = ₹ 425 ∴ Cost of 1 m<sup>2</sup> of canvas = ₹ 4.25

 $\therefore$  Cost of 1 m of canvas =  $(4.25)^2$ 

Thus, cost of 4818 m<sup>2</sup> of canvas = ₹ 20476.50

cylinder 
$$= \frac{1}{3}\pi r^2 h_1 + \pi r^2 h = \pi r^2 \left(\frac{1}{3}h_1 + h\right)$$
  
 $= \frac{22}{7} \times (21)^2 \left[\frac{20}{3} + 22\right] = \frac{9702}{7} \times \frac{86}{3} = 39732 \text{ m}^3$ 

(v) (a): Required number of persons

$$\frac{\text{Volume of tent}}{\text{Space required by one person}} = \frac{39732}{1892} = 21$$

**11.** (i) Curved surface area of two identical cylindrical parts =  $2 \times 2\pi rh = 2 \times 2 \times \frac{22}{7} \times \frac{2.5}{2} \times 5$ = 78.57 cm<sup>2</sup> (ii) Volume of big cylindrical part =  $\pi r^2 h$ 

$$= \frac{22}{7} \times \frac{4.3}{2} \times \frac{4.3}{2} \times 12 = 190.93 \text{ cm}^3$$
(iii) Volume of two hemispherical ends  $= 2 \times \frac{2}{3} \pi r^3$ 
 $= \frac{2 \times 2}{3} \times \frac{22}{7} \times \left(\frac{2.5}{2}\right)^3 = 8.18 \text{ cm}^3$ 

(iv) Curved surface area of two hemispherical ends

MtG 100 PERCENT Mathematics Class-10

$$= 2 \times 2\pi r^{2} = 2 \times 2 \times \frac{22}{7} \times \frac{2.5}{2} \times \frac{2.5}{2} = 19.64 \text{ cm}^{2}$$

(v) Difference of volume of bigger cylinder to two small hemispherical ends =  $190.93 - 8.18 = 182.75 \text{ cm}^3$ 

**12.** Radius of the sphere 
$$(r) = \frac{18}{2}$$
 cm = 9 cm

Radius of the cylinder (*R*) =  $\frac{36}{2}$  cm = 18 cm

Let us assume that the water level in the cylinder rises by h cm.

After the sphere is completely submerged,

Volume of the sphere = Volume of water raised in the cylinder

$$\Rightarrow \quad \frac{4}{3}\pi r^3 = \pi R^2 h \quad \Rightarrow \quad \frac{4}{3}\pi (9)^3 = \pi (18)^2 \times h$$
$$\Rightarrow \quad h = \frac{4 \times 9 \times 9 \times 9}{3 \times 18 \times 18} \quad \Rightarrow \quad h = 3$$

Thus, the water level in the cylinder rises by 3 cm.

**13.** Let *l*, *r* and *h* be the slant height, radius and height of the conical top respectively.

:.  $l^2 = r^2 + h^2 = 3^2 + 4^2 = 25 = 5^2 \implies l = 5 \text{ m}$ 

Curved surface area of cylindrical part =  $2\pi rh$ 

 $= 2\pi(3)(10) = 60\pi \text{ m}^2$ 

Curved surface area of conical part =  $\pi rl = \pi(3)(5)$ =  $15\pi$  m<sup>2</sup>

.: Curved surface area of pillar

= Curved surface area of cylindrical part + Curved surface area of conical part =  $60\pi + 15\pi = 75\pi$  m<sup>2</sup>

**14.** Volume of one cube =  $64 \text{ cm}^3$ 

 $\Rightarrow (Edge)^3 = 64 \text{ cm}^3 \Rightarrow Edge = 4 \text{ cm}$ Length of the cuboid (*l*) = 5 × Edge = 5 × 4 = 20 cm breadth (*b*) = 4 cm and height (*h*) = 4 cm

 $\therefore$  Surface area of cuboid = 2(*lb* + *bh* + *hl*)

$$= 2[20 \times 4 + 4 \times 4 + 4 \times 20] = 2 \times 176 = 352 \text{ cm}^2$$

Volume of the cuboid =  $l \times b \times h$ = 20 × 4 × 4 = 320 cm<sup>3</sup>

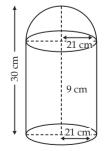

**15.** Radius of the hemisphere and cylinder, *r* 

$$=\frac{42}{2}=21$$
 cm

Height of the cylinder, h = 30 - 21 = 9 cm

∴ Internal surface area of the vessel = Curved surface area of cylinder + Curved surface area of hemisphere

$$= 2\pi rh + 2\pi r^{2} = 2\pi r(h + r)$$
$$= 2 \times \frac{22}{7} \times 21(9 + 21) = 3960 \text{ cm}^{2}$$

**16.** We know that, capacity of cylindrical vessel =  $\pi r^2 h \text{ cm}^3$ and capacity of hemisphere =  $\frac{2}{2}\pi r^3$  cm

From the figure, capacity of the cylindrical vessel

$$=\pi r^2 h - \frac{2}{3}\pi r^3 = \frac{1}{3}\pi r^2 [3h - 2r]$$

**17.** Given that, side of a solid cube (a) = 7 cm Height of conical cavity (h) = 7 cmRadius of conical cavity (r) = 3 cm Now, volume of cube  $= a^3 = (7)^3 = 343 \text{ cm}^3$ 7 cm

Volume of conical cavity

$$=\frac{1}{3}\pi \times r^2 \times h = \frac{1}{3} \times \frac{22}{7} \times 3 \times 3 \times 7$$
$$= 66 \text{ cm}^3$$

Volume of remaining solid *.*..

= Volume of cube - Volume of conical cavity

 $= 343 - 66 = 277 \text{ cm}^3$ 

**18.** Here, radius of cylindrical portion (r) = Radius of conical portion (r) =  $\frac{105}{2}$  m

Height of cylindrical portion (h) = 3 m Slant height of conical portion (l) = 53 m

Total canvas used in making the tent

= Curved surface area of cylindrical portion + Curved surface area of conical portion

$$= 2\pi rh + \pi rl = 2 \times \frac{22}{7} \times \frac{105}{2} \times 3 + \frac{22}{7} \times \frac{105}{2} \times 53$$

 $= 990 + 8745 = 9735 \text{ m}^2$ 

**19.** Total curved surface

area of hollow cylinder  $= 2\pi RH + 2\pi rH = 1320$ 

$$\Rightarrow 2 \times \frac{22}{2} \times 14(8+r) = 1320$$

$$7 \rightarrow 88(8+r) = 1320$$

$$\Rightarrow 8 + r = \frac{1320}{88} \Rightarrow 8 + r = 15 \Rightarrow r = 7$$

Internal diameter = 2r = 14 cm *:*..

**20.** Radius of cone (r) = 7 cm = Radius of hemisphere

Height of cone (h) = 14 cm Volume of solid *.*... 14 cm = Volume of cone + volume of hemisphere B ----7 cm  $=\frac{1}{3}\pi r^{2}h+\frac{2}{3}\pi r^{3}=\frac{\pi r^{2}}{3}[h+2r]$ 

$$= \frac{1}{3} \times \frac{22}{7} \times 7 \times 7 \times [14 + (2 \times 7)]$$
$$= \frac{22}{3} \times 7 \times 28 = \frac{4312}{3} = 1437.33 \text{ cm}^3$$

**21.** Diameter of hemisphere = Edge of cube = 7 cm

$$(r) = \frac{7}{2} \, \text{cm}$$

Required surface area = surface area of cube - area of top of hemisphere + curved surface area of hemisphere  $= 6a^2 - \pi r^2 + 2\pi r^2 = 6a^2 + \pi r^2$ 

$$= 6(7)^2 + \pi \left(\frac{7}{2}\right)^2$$

 $= 6 \times 49 + \frac{22}{7} \times \frac{7}{2} \times \frac{7}{2}$ 

 $= 294 + 38.5 = 332.5 \text{ cm}^2$ 

22. Given, ice-cream cone is the combination of a hemisphere and a cone.

Also, radius of hemisphere, r = 5 cm

$$\therefore$$
 Volume of hemisphere =  $\frac{2}{3}\pi r^3$ 

$$=\frac{2}{3} \times \frac{22}{7} \times (5)^3 = \frac{5500}{21} = 261.90 \text{ cm}^3$$

Now, radius of the cone = 5 cm

and height of the cone, h

= height of ice-cream cone - radius of hemisphere

$$= 10 - 5 = 5 \text{ cm}$$

14 cm

8 cm

$$\therefore$$
 Volume of the cone =  $\frac{1}{3}\pi r^2 h$ 

$$=\frac{1}{3} \times \frac{22}{7} \times (5)^2 \times 5 = \frac{2750}{21} = 130.95 \text{ cm}^3$$

Now, total volume of ice-cream cone =

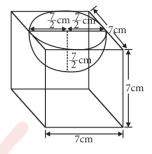

volume of hemisphere + volume of cone

$$= 261.90 + 130.95 = 392.85 \text{ cm}^3$$

Since,  $\frac{1}{6}$  part is left unfilled with ice-cream.

Required volume of ice-cream *.*..

$$= 392.85 - 392.85 \times \frac{1}{6} = 392.85 - 65.475 = 327.4 \text{ cm}^3$$
