

# Areas of Parallelograms and Triangles

## EXERCISE - 9.1

1. The figures (i), (iii) and (v) lie on the same base and between the same parallels.

	Common base	Two parallels
Fig. (i)	DC	DC and AB
Fig. (iii)	QR	QR and PS
Fig. (v)	AD	AD and BQ

## EXERCISE - 9.2

1. We have,  $AB = 16$  cm  
 $\therefore AB = CD$  [Opposite sides of parallelogram]  
 $\therefore CD = 16$  cm

Now, area of parallelogram  $ABCD = CD \times AE$   
 $= (16 \times 8) \text{ cm}^2 = 128 \text{ cm}^2$

Since,  $CF \perp AD$

$\therefore$  Area of parallelogram  $ABCD = AD \times CF$   
 $\Rightarrow AD \times CF = 128 \Rightarrow AD \times 10 = 128$  [ $\because CF = 10$  cm]  
 $\Rightarrow AD = \frac{128}{10} = 12.8$

Thus, the required length of  $AD$  is 12.8 cm.

2. Join  $GE$  and  $HF$ , then  $GE \parallel BC \parallel DA$  and  $HF \parallel AB \parallel DC$ .

$\therefore AB = DC \Rightarrow AE = DG$   
 and  $AB \parallel DC$   
 $\Rightarrow AE \parallel DG$ .

Thus,  $AEGD$  is a parallelogram.

Similarly,  $ABFH$ ,  $DCFH$  and  $EBCG$  are parallelograms.

We know that, if a triangle and a parallelogram are on the same base and between the same parallels, then the area of the triangle is equal to half the area of the parallelogram.

Now,  $\triangle EFG$  and parallelogram  $EBCG$  are on the same base  $EG$  and between the same parallels  $EG$  and  $BC$ .

$$\therefore ar(\triangle EFG) = \frac{1}{2} ar(\parallel^{\text{gm}} EBCG) \quad \dots (i)$$

$$\text{Similarly, } ar(\triangle EHG) = \frac{1}{2} ar(\parallel^{\text{gm}} AEGD) \quad \dots (ii)$$

Adding (i) and (ii), we get

$$ar(\triangle EFG) + ar(\triangle EHG) = \frac{1}{2} [ar(\parallel^{\text{gm}} EBCG) + ar(\parallel^{\text{gm}} AEGD)]$$

$$\Rightarrow ar(EFGH) = \frac{1}{2} ar(\parallel^{\text{gm}} ABCD)$$

Hence proved.

3. Since,  $\triangle APB$  and parallelogram  $ABCD$  are on the same base  $AB$  and between the same parallels  $AB$  and  $CD$ .

$$\therefore ar(\triangle APB) = \frac{1}{2} ar(\parallel^{\text{gm}} ABCD) \quad \dots (i)$$

Also,  $\triangle BQC$  and parallelogram  $ABCD$  are on the same base  $BC$  and between the same parallels  $BC$  and  $AD$ .

$$\therefore ar(\triangle BQC) = \frac{1}{2} ar(\parallel^{\text{gm}} ABCD) \quad \dots (ii)$$

From (i) and (ii), we have  
 $ar(\triangle APB) = ar(\triangle BQC)$ .

Hence proved.

4. We have a parallelogram  $ABCD$ , i.e.,  $AB \parallel CD$  and  $BC \parallel AD$ . Let us draw  $EF \parallel AB$  and  $HG \parallel AD$  through  $P$ .

Clearly,  $AEFB$ ,  $CDEF$ ,  $ADGH$  and  $BCGH$ , all are parallelograms.

(i) Since,  $\triangle APB$  and parallelogram  $AEFB$  are on the same base  $AB$  and between the same parallels  $AB$  and  $EF$ .

$$\therefore ar(\triangle APB) = \frac{1}{2} ar(\parallel^{\text{gm}} AEFB) \quad \dots (1)$$

Also,  $\triangle PCD$  and parallelogram  $CDEF$  are on the same base  $CD$  and between the same parallels  $CD$  and  $EF$ .

$$\therefore ar(\triangle PCD) = \frac{1}{2} ar(\parallel^{\text{gm}} CDEF) \quad \dots (2)$$

Adding (1) and (2), we get

$$ar(\triangle APB) + ar(\triangle PCD) = \frac{1}{2} ar(\parallel^{\text{gm}} AEFB) + \frac{1}{2} ar(\parallel^{\text{gm}} CDEF)$$

$$\Rightarrow ar(\triangle APB) + ar(\triangle PCD) = \frac{1}{2} ar(\parallel^{\text{gm}} ABCD) \quad \dots (3)$$

(ii)  $\triangle APD$  and parallelogram  $ADGH$  are on the same base  $AD$  and between the same parallels  $AD$  and  $GH$ .

$$\therefore ar(\triangle APD) = \frac{1}{2} ar(\parallel^{\text{gm}} ADGH) \quad \dots (4)$$

$$\text{Similarly, } ar(\triangle PBC) = \frac{1}{2} ar(\parallel^{\text{gm}} BCGH) \quad \dots (5)$$

Adding (4) and (5), we get

$$ar(\triangle APD) + ar(\triangle PBC) =$$

$$\frac{1}{2} ar(\parallel^{\text{gm}} ADGH) + \frac{1}{2} ar(\parallel^{\text{gm}} BCGH)$$

$$\Rightarrow ar(\triangle APD) + ar(\triangle PBC) = \frac{1}{2} ar(\parallel^{\text{gm}} ABCD) \quad \dots (6)$$

From (3) and (6), we get

$$ar(\triangle APD) + ar(\triangle PBC) = ar(\triangle APB) + ar(\triangle PCD)$$

5. (i) Parallelogram  $PQRS$  and parallelogram  $ABRS$  are on the same base  $RS$  and between the same parallels  $RS$  and  $PB$ .

$$\therefore ar(\parallel^{\text{gm}} PQRS) = ar(\parallel^{\text{gm}} ABRS)$$

(ii)  $\Delta AXS$  and parallelogram  $ABRS$  are on the same base  $AS$  and between the same parallels  $AS$  and  $BR$ .

$$\therefore ar(\Delta AXS) = \frac{1}{2} ar(\parallel^{\text{gm}} ABRS) \quad \dots(1)$$

But  $ar(\parallel^{\text{gm}} PQRS) = ar(\parallel^{\text{gm}} ABRS)$  [Proved in (i) part]  $\dots(2)$

$$\therefore \text{From (1) and (2), we get } ar(\Delta AXS) = \frac{1}{2} ar(PQRS)$$

6. Given, the farmer is having a field in the form of parallelogram  $PQRS$  and a point  $A$  is situated on  $RS$ . Join  $AP$  and  $AQ$ .

Clearly, the field is divided into three parts *i.e.*,  $\Delta APS$ ,  $\Delta PAQ$  and  $\Delta QAR$ .

Now, as  $\Delta PAQ$  and parallelogram  $PQRS$  are on the same base  $PQ$  and between the same parallels  $PQ$  and  $RS$ .

$$\therefore ar(\Delta PAQ) = \frac{1}{2} ar(\parallel^{\text{gm}} PQRS) \quad \dots(i)$$

Now,  $ar(\parallel^{\text{gm}} PQRS) - ar(\Delta PAQ)$

$$= ar(\parallel^{\text{gm}} PQRS) - \frac{1}{2} ar(\parallel^{\text{gm}} PQRS) \quad \text{[From (i)]}$$

$$\Rightarrow ar(\Delta APS) + ar(\Delta QAR) = \frac{1}{2} ar(\parallel^{\text{gm}} PQRS) \quad \dots(ii)$$

From (i) and (ii), we have

$$ar(\Delta PAQ) = ar(\Delta APS) + ar(\Delta QAR)$$

Thus, the farmer can sow wheat in  $\Delta PAQ$  and pulses in  $\Delta APS$  and  $\Delta QAR$  or wheat in  $\Delta APS$  and  $\Delta QAR$  and pulses in  $\Delta PAQ$ .

### EXERCISE - 9.3

1. In  $\Delta ABC$ ,  $AD$  is a median.

$$\therefore ar(\Delta ABD) = ar(\Delta ADC) \quad \dots(i)$$

[ $\because$  A median divides the triangle into two triangles of equal area]

Similarly, in  $\Delta BEC$ , we have

$$ar(\Delta BED) = ar(\Delta DEC) \quad \dots(ii)$$

Subtracting (ii) from (i), we get

$$ar(\Delta ABD) - ar(\Delta BED) = ar(\Delta ADC) - ar(\Delta DEC)$$

$$\Rightarrow ar(\Delta ABE) = ar(\Delta ACE).$$

2. In a  $\Delta ABC$ ,  $AD$  is a median.

Since, a median divides the triangle into two triangles of equal area.

$$\therefore ar(\Delta ABD) = \frac{1}{2} ar(\Delta ABC) \quad \dots(i)$$

Join  $B$  and  $E$ .

Now, in  $\Delta ABD$ ,  $BE$  is a median.

[ $\because$   $E$  is the mid-point of  $AD$ ]

$$\therefore ar(\Delta BED) = \frac{1}{2} ar(\Delta ABD) \quad \dots(ii)$$

From (i) and (ii), we get

$$ar(\Delta BED) = \frac{1}{2} \left[ \frac{1}{2} ar(\Delta ABC) \right]$$

$$\Rightarrow ar(\Delta BED) = \frac{1}{4} ar(\Delta ABC)$$

3. Let  $ABCD$  be a parallelogram such that its diagonals intersect at  $O$ .

$\therefore$  Diagonals of a parallelogram bisect each other.

$$\therefore AO = OC \text{ and } BO = OD$$

Since, a median of a triangle divides it into two triangles of equal area.

$$\therefore ar(\Delta BOC) = ar(\Delta DOC) \quad \dots(i)$$

$$\text{Similarly, } ar(\Delta AOD) = ar(\Delta DOC) \quad \dots(ii)$$

$$\text{and } ar(\Delta AOB) = ar(\Delta BOC) \quad \dots(iii)$$

From (i), (ii) and (iii), we get

$$ar(\Delta AOB) = ar(\Delta BOC) = ar(\Delta COD) = ar(\Delta AOD)$$

Thus, the diagonals of a parallelogram divide it into four triangles of equal area.

4. We have,  $\Delta ABC$  and  $\Delta ABD$  are on the same base  $AB$ .

$\therefore CD$  is bisected at  $O$ . [Given]

$$\therefore CO = DO$$

Since, a median of a triangle divides it into two triangles of equal area.

$$\therefore ar(\Delta OAC) = ar(\Delta OAD) \quad \dots(i)$$

$$\text{Similarly, } ar(\Delta OBC) = ar(\Delta OBD) \quad \dots(ii)$$

Adding (i) and (ii), we get

$$ar(\Delta OAC) + ar(\Delta OBC) = ar(\Delta OAD) + ar(\Delta OBD)$$

$$\Rightarrow ar(\Delta ABC) = ar(\Delta ABD)$$

5. We have,  $\Delta ABC$  such that  $D$ ,  $E$  and  $F$  are the mid-points of  $BC$ ,  $CA$  and  $AB$  respectively.

(i) In  $\Delta ABC$ ,  $E$  and  $F$  are the mid-points of  $AC$  and  $AB$  respectively.

$$\therefore EF \parallel BC \text{ and } EF = \frac{1}{2} BC \quad \text{[By mid-point theorem]}$$

$$\Rightarrow EF \parallel BD \text{ and } EF = BD \quad [\because D \text{ is the mid-point of } BC]$$

Now,  $BDEF$  is a quadrilateral whose one pair of opposite sides is parallel and of equal lengths.

$\therefore BDEF$  is a parallelogram.

(ii) We have proved that  $BDEF$  is a parallelogram.

Similarly,  $DCEF$  is a parallelogram and  $DEAF$  is a parallelogram.

Now, as diagonal of a parallelogram divides it into two triangles of equal area

$$\therefore ar(\Delta BDF) = ar(\Delta DEF) \quad \dots(1)$$

[ $\because FD$  is a diagonal of parallelogram  $BDEF$ ]

$$\text{Similarly, } ar(\Delta CDE) = ar(\Delta DEF) \quad \dots(2)$$

$$\text{and } ar(\Delta AEF) = ar(\Delta DEF) \quad \dots(3)$$

From (1), (2) and (3), we have

$$ar(\Delta AEF) = ar(\Delta FBD) = ar(\Delta CDE) = ar(\Delta DEF)$$

$$\text{Thus, } ar(\Delta ABC) = ar(\Delta AEF) + ar(\Delta FBD) + ar(\Delta CDE) + ar(\Delta DEF) = 4 ar(\Delta DEF)$$

$$\Rightarrow ar(\Delta DEF) = \frac{1}{4} ar(\Delta ABC)$$

$$\begin{aligned} \text{(iii) We have, } ar(\parallel^{\text{gm}} BDEF) &= ar(\triangle BDF) + ar(\triangle DEF) \\ &= ar(\triangle DEF) + ar(\triangle DEF) \quad [\because ar(\triangle DEF) = ar(\triangle BDF)] \\ &= 2ar(\triangle DEF) \\ &= 2\left[\frac{1}{4}ar(\triangle ABC)\right] = \frac{1}{2}ar(\triangle ABC) \end{aligned}$$

Thus,  $ar(\parallel^{\text{gm}} BDEF) = \frac{1}{2}ar(\triangle ABC)$ .

6. We have a quadrilateral  $ABCD$  whose diagonals  $AC$  and  $BD$  intersect at  $O$  such that  $OB = OD$ .

Also, we have  $AB = CD$

Let us draw  $DE \perp AC$  and  $BF \perp AC$ .

(i) In  $\triangle DEO$  and  $\triangle BFO$ , we have  
 $DO = BO$  [Given]  
 $\angle DOE = \angle BOF$  [Vertically opposite angles]  
 $\angle DEO = \angle BFO$  [Each  $90^\circ$ ]  
 $\therefore \triangle DEO \cong \triangle BFO$  [By AAS congruency criterion]  
 $\Rightarrow DE = BF$  [By CPCT]

and  $ar(\triangle DEO) = ar(\triangle BFO)$  ... (1)

Now, in  $\triangle DEC$  and  $\triangle BFA$ , we have

$\angle DEC = \angle BFA$  [Each  $90^\circ$ ]  
 $DE = BF$  [Proved above]  
 $DC = BA$  [Given]  
 $\therefore \triangle DEC \cong \triangle BFA$  [By RHS congruency criterion]  
 $\Rightarrow ar(\triangle DEC) = ar(\triangle BFA)$  ... (2)  
 and  $\angle 1 = \angle 2$  [By CPCT] ... (3)

$\therefore$  Adding (1) and (2), we get  
 $ar(\triangle DEO) + ar(\triangle DEC) = ar(\triangle BFO) + ar(\triangle BFA)$   
 $\Rightarrow ar(\triangle DOC) = ar(\triangle AOB)$

(ii) Since,  $ar(\triangle DOC) = ar(\triangle AOB)$  [Proved above]  
 Adding  $ar(\triangle BOC)$  on both sides, we get

$$ar(\triangle DOC) + ar(\triangle BOC) = ar(\triangle AOB) + ar(\triangle BOC)$$

$$\Rightarrow ar(\triangle DCB) = ar(\triangle ACB)$$

(iii) Since,  $\triangle DCB$  and  $\triangle ACB$  are on the same base  $CB$  and having equal areas.

$\therefore$  They must lie between the same parallels.  
 $\Rightarrow CB \parallel DA$   
 Also,  $\angle 1 = \angle 2$ , [From (3)]  
 which form a pair of alternate interior angles.

So,  $AB \parallel CD$   
 Hence,  $ABCD$  is a parallelogram.

7. We have, a  $\triangle ABC$  and points  $D$  and  $E$  on  $AB$  and  $AC$  respectively are such that  $ar(\triangle DBC) = ar(\triangle EBC)$ .  
 Since,  $\triangle DBC$  and  $\triangle EBC$  are on the same base  $BC$  and having same area.  
 $\therefore$  They must lie between the same parallels.

Hence,  $DE \parallel BC$   
 Hence proved.

8. We have, a  $\triangle ABC$  such that  $XY \parallel BC$ ,  $BE \parallel AC$  and  $CF \parallel AB$ .

Since,  $XY \parallel BC$  and  $BE \parallel AC$ .

$\therefore BCYE$  is a parallelogram.

Now, the parallelogram  $BCYE$  and  $\triangle ABE$  are on the same base

$BE$  and between the same parallels  $BE$  and  $AC$ .

$$\therefore ar(\triangle ABE) = \frac{1}{2} ar(\parallel^{\text{gm}} BCYE) \quad \dots(i)$$

Again,  $XY \parallel BC$  and  $CF \parallel AB$  [Given]

$\Rightarrow XF \parallel BC$  and  $CF \parallel XB$

$\therefore BCFX$  is a parallelogram.

Now,  $\triangle ACF$  and parallelogram  $BCFX$  are on the same base  $CF$  and between the same parallels  $AB$  and  $FC$ .

$$\therefore ar(\triangle ACF) = \frac{1}{2} ar(\parallel^{\text{gm}} BCFX) \quad \dots(ii)$$

Also parallelogram  $BCFX$  and parallelogram  $BCYE$  are on the same base  $BC$  and between the same parallels  $BC$  and  $EF$ .

$$\therefore ar(\parallel^{\text{gm}} BCFX) = ar(\parallel^{\text{gm}} BCYE) \quad \dots(iii)$$

From (i), (ii) and (iii), we get

$$ar(\triangle ABE) = ar(\triangle ACF)$$

9. Join  $AC$  and  $PQ$ .

We know that diagonal of a parallelogram divides it into two triangles of equal area.

$$\therefore ar(\triangle ABC) = \frac{1}{2} ar(\parallel^{\text{gm}} ABCD) \quad \dots(i)$$

[ $\because ABCD$  is a parallelogram and  $AC$  is its diagonal.]

Again,  $PBQR$  is a parallelogram and  $QP$  is its diagonal.

$$\therefore ar(\triangle BPQ) = \frac{1}{2} ar(\parallel^{\text{gm}} PBQR) \quad \dots(ii)$$

Since,  $\triangle ACQ$  and  $\triangle APQ$  are on the same base  $AQ$  and between the same parallels  $AQ$  and  $CP$ .

$$\therefore ar(\triangle ACQ) = ar(\triangle APQ)$$

$$\Rightarrow ar(\triangle ACQ) - ar(\triangle ABQ) = ar(\triangle APQ) - ar(\triangle ABQ)$$

[Subtracting  $ar(\triangle ABQ)$  from both sides]

$$\Rightarrow ar(\triangle ABC) = ar(\triangle BPQ) \quad \dots(iii)$$

From (i), (ii) and (iii), we get

$$\frac{1}{2} ar(\parallel^{\text{gm}} ABCD) = \frac{1}{2} ar(\parallel^{\text{gm}} PBQR)$$

$$\Rightarrow ar(\parallel^{\text{gm}} ABCD) = ar(\parallel^{\text{gm}} PBQR)$$

10. We have, a trapezium  $ABCD$  with  $AB \parallel CD$  and its diagonals  $AC$  and  $BD$  intersect at  $O$ .

Since, triangles on the same base and between the same parallels have equal areas and here  $\triangle ABD$  and  $\triangle ABC$  are on the same base  $AB$  and between the same parallels  $AB$  and  $DC$ .

$$\therefore ar(\triangle ABD) = ar(\triangle ABC)$$

Subtracting  $ar(\triangle AOB)$  from both sides, we get

$$ar(\triangle ABD) - ar(\triangle AOB) = ar(\triangle ABC) - ar(\triangle AOB)$$

$$\Rightarrow ar(\triangle AOD) = ar(\triangle BOC)$$

11. We have, a pentagon  $ABCDE$  and a line  $BF$  such that  $BF \parallel AC$  and intersect  $DC$  produced at  $F$ .

(i) Since, the triangles between the same parallels and on the same base are equal in area and here  $\triangle ACB$  and  $\triangle ACF$  are on the same base  $AC$  and between the same parallels  $AC$  and  $BF$ .

$$\therefore ar(\triangle ACB) = ar(\triangle ACF)$$

(ii) Since,  $ar(\triangle ACB) = ar(\triangle ACF)$  [Proved above]  
 Adding  $ar(\text{quad. } AEDC)$  on both sides, we get  
 $ar(\triangle ACB) + ar(\text{quad. } AEDC) = ar(\triangle ACF) + ar(\text{quad. } AEDC)$   
 $\therefore ar(ABCDE) = ar(AEDF)$

**12.** Let the plot be in the form of a quadrilateral  $ABCD$ .

Join  $AC$ .

Draw  $DF \parallel AC$  such that it meets  $BC$  produced at  $F$  and join  $A$  and  $F$ .

Now,  $\triangle DAF$  and  $\triangle DCF$  are on the same base  $DF$  and between the same parallels  $AC$  and  $DF$ .

$$\therefore ar(\triangle DAF) = ar(\triangle DCF)$$

Subtracting  $ar(\triangle DEF)$  from both sides, we get

$$ar(\triangle DAF) - ar(\triangle DEF) = ar(\triangle DCF) - ar(\triangle DEF)$$

$$\Rightarrow ar(\triangle ADE) = ar(\triangle CEF)$$

Thus, the portion of  $\triangle ADE$  can be taken over by the Gram Panchayat by adding the land ( $\triangle CEF$ ) to his (Itwari) land so as to form a triangular plot *i.e.*,  $\triangle ABF$ .

Note that  $ar(\triangle ABF) = ar(\text{quad. } ABCD)$ .

$$[\therefore ar(\triangle CEF) = ar(\triangle ADE)] \quad \text{[Proved above]}$$

$\therefore$  Adding  $ar(\text{quad. } ABCE)$  on both sides, we get

$$ar(\triangle CEF) + ar(\text{quad. } ABCE) = ar(\triangle ADE) + ar(\text{quad. } ABCE)$$

$$\Rightarrow ar(\triangle ABF) = ar(\text{quad. } ABCD)]$$

**13.** We have, a trapezium  $ABCD$  with  $AB \parallel DC$  and a line  $XY$  such that  $XY \parallel AC$  meets  $AB$  at  $X$  and  $BC$  at  $Y$ .

Join  $CX$ .

$\therefore \triangle ADX$  and  $\triangle ACX$  are on the same base  $AX$  and between the same parallels  $AB$  and  $DC$ .

$$\therefore ar(\triangle ADX) = ar(\triangle ACX) \quad \dots(i)$$

$\therefore \triangle ACX$  and  $\triangle ACY$  are on the same base  $AC$  and between the same parallels  $AC$  and  $XY$ .

$$\therefore ar(\triangle ACX) = ar(\triangle ACY) \quad \dots(ii)$$

From (i) and (ii), we have  $ar(\triangle ADX) = ar(\triangle ACY)$

Hence proved.

**14.** We have,  $AP \parallel BQ \parallel CR$ .

$\therefore \triangle BCQ$  and  $\triangle BQR$  are on the same base  $BQ$  and between the same parallels  $BQ$  and  $CR$ .

$$\therefore ar(\triangle BCQ) = ar(\triangle BQR) \quad \dots(i)$$

Similarly,  $\triangle ABQ$  and  $\triangle PBQ$  are on the same base  $BQ$  and between the same parallels  $AP$  and  $BQ$ .

$$\therefore ar(\triangle ABQ) = ar(\triangle PBQ) \quad \dots(ii)$$

Adding (i) and (ii), we get

$$ar(\triangle BCQ) + ar(\triangle ABQ) = ar(\triangle BQR) + ar(\triangle PBQ)$$

$$\Rightarrow ar(\triangle AQC) = ar(\triangle PBR)$$

Hence proved.

**15.** We have, a quadrilateral  $ABCD$  and its diagonals  $AC$  and  $BD$  intersect at  $O$  such that

$$ar(\triangle AOD) = ar(\triangle BOC)$$

Adding  $ar(\triangle AOB)$  on both sides, we get  
 $ar(\triangle AOD) + ar(\triangle AOB) = ar(\triangle BOC) + ar(\triangle AOB)$   
 $\Rightarrow ar(\triangle ABD) = ar(\triangle ABC)$

Also, they lie on the same base  $AB$ .

$\therefore$  They must lie between the same parallels.

$$\therefore AB \parallel DC$$

Now,  $ABCD$  is a quadrilateral having a pair of opposite sides parallel. So,  $ABCD$  is a trapezium.

Hence proved.

**16.** We have,  $ar(\triangle DRC) = ar(\triangle DPC)$  [Given]

Also, they lie on the same base  $DC$ .

$\therefore \triangle DRC$  and  $\triangle DPC$  must lie between the same parallels.

So,  $DC \parallel RP$ . Thus, a pair of opposite sides of quadrilateral  $DCPR$  is parallel.

$\therefore$  Quadrilateral  $DCPR$  is a trapezium.

Again, we have

$$ar(\triangle BDP) = ar(\triangle ARC) \quad \dots(i)$$

$$\text{Also, we have } ar(\triangle DPC) = ar(\triangle DRC) \quad \dots(ii)$$

Subtracting (ii) from (i), we get

$$ar(\triangle BDP) - ar(\triangle DPC) = ar(\triangle ARC) - ar(\triangle DRC)$$

$$\Rightarrow ar(\triangle BDC) = ar(\triangle ADC)$$

Also, they lie on the same base  $DC$ .

$\therefore \triangle BDC$  and  $\triangle ADC$  must lie between the same parallels.

So,  $AB \parallel DC$  and hence quadrilateral  $ABCD$  is a trapezium.

### EXERCISE - 9.4

**1.** We have, a parallelogram  $ABCD$  and a rectangle  $ABEF$  such that

$$ar(\text{||}^m ABCD) = ar(\text{rect. } ABEF)$$

Now,  $AB = CD$

[Opposite sides of parallelogram]

and  $AB = EF$

[Opposite sides of a rectangle]

$$\Rightarrow CD = EF$$

$$\Rightarrow AB + CD = AB + EF$$

$$\dots(i)$$

Now,  $BE < BC$  and  $AF < AD$

[ $\therefore$  In a right triangle, hypotenuse is the longest side]

$$\Rightarrow (BC + AD) > (BE + AF) \quad \dots(ii)$$

From (i) and (ii), we get

$$(AB + CD) + (BC + AD) > (AB + EF) + (BE + AF)$$

$$\Rightarrow (AB + BC + CD + DA) > (AB + BE + EF + FA)$$

$$\Rightarrow \text{Perimeter of parallelogram } ABCD >$$

$$\text{Perimeter of rectangle } ABEF$$

**2.** Draw  $AF$  perpendicular to  $BC$ .

Then,  $AF$  will be the height of  $\triangle ABD$ ,  $\triangle ADE$  and  $\triangle AEC$ .

$$\text{Area of a triangle} = \frac{1}{2} \times \text{base} \times \text{height}$$

$$\therefore ar(\triangle ABD) = \frac{1}{2} \times BD \times AF$$

$$\text{Similarly, } ar(\triangle ADE) = \frac{1}{2} \times DE \times AF \quad \text{and}$$

$$ar(\triangle AEC) = \frac{1}{2} \times EC \times AF$$

Since,  $BD = DE = EC$

$$\therefore \left(\frac{1}{2} \times BD \times AF\right) = \left(\frac{1}{2} \times DE \times AF\right) = \left(\frac{1}{2} \times EC \times AF\right)$$

$$\Rightarrow ar(\triangle ABD) = ar(\triangle ADE) = ar(\triangle AEC).$$

3. We have, parallelograms  $ABCD$ ,  $DCFE$  and  $ABFE$ .

Since, opposite sides of parallelogram are equal.

$$\therefore AD = BC, DE = CF \text{ and } AE = BF \quad \dots(i)$$

In  $\triangle ADE$  and  $\triangle BCF$ , we have

$$AD = BC, DE = CF \text{ and } AE = BF \quad \text{(From (i))}$$

$$\therefore \triangle ADE \cong \triangle BCF \quad \text{(By SSS congruence criterion)}$$

$$\Rightarrow ar(\triangle ADE) = ar(\triangle BCF)$$

4. We have, a parallelogram  $ABCD$  and  $AD = CQ$ .

Let us join  $AC$ .

We know that triangles on the same base and between the same parallels are equal in area. Since  $\triangle QAC$  and  $\triangle QDC$  are on the same base  $QC$  and between the same parallels  $AD$  and  $BQ$ .

$$\therefore ar(\triangle QAC) = ar(\triangle QDC)$$

Subtracting  $ar(\triangle QPC)$  from both sides, we get

$$ar(\triangle QAC) - ar(\triangle QPC) = ar(\triangle QDC) - ar(\triangle QPC) \\ \Rightarrow ar(\triangle PAC) = ar(\triangle QDP) \quad \dots(i)$$

Since,  $\triangle PAC$  and  $\triangle PBC$  are on the same base  $PC$  and between the same parallels  $AB$  and  $CD$

$$\therefore ar(\triangle PAC) = ar(\triangle PBC) \quad \dots(ii)$$

From (i) and (ii), we get

$$ar(\triangle PBC) = ar(\triangle QDP)$$

5. Join  $EC$  and  $AD$ . Draw  $EP \perp BC$ .

Let  $AB = BC = CA = a$ , then  $BD = DE = BE = \frac{a}{2}$ .

$$(i) \text{ Clearly, } ar(\triangle ABC) = \frac{\sqrt{3}}{4} a^2 \text{ and}$$

$$ar(\triangle BDE) = \frac{\sqrt{3}}{4} \left(\frac{a}{2}\right)^2 = \frac{\sqrt{3}}{16} a^2$$

$$\Rightarrow ar(\triangle BDE) = \frac{1}{4} ar(\triangle ABC)$$

(ii) Since,  $\triangle ABC$  and  $\triangle BED$  are equilateral triangles.

$$\therefore \angle ACB = \angle DBE = 60^\circ$$

$\Rightarrow BE \parallel AC$  [ $\because$  A pair of alternate interior angles is equal.]

Now, as  $\triangle BAE$  and  $\triangle BEC$  are on the same base  $BE$  and between the same parallels  $BE$  and  $AC$ .

$$\therefore ar(\triangle BAE) = ar(\triangle BEC)$$

$$\Rightarrow ar(\triangle BAE) = 2 ar(\triangle BDE)$$

$$[\because DE \text{ is median of } \triangle BEC \therefore ar(\triangle BEC) = 2 ar(\triangle BDE)]$$

$$\Rightarrow ar(\triangle BDE) = \frac{1}{2} ar(\triangle BAE)$$

(iii) Since,  $ar(\triangle ABC) = 4 ar(\triangle BDE)$  [Proved in (i) part]

$$ar(\triangle BEC) = 2 ar(\triangle BDE) \quad [\because DE \text{ is median of } \triangle BEC]$$

$$\Rightarrow ar(\triangle ABC) = 2 ar(\triangle BEC)$$

(iv) Since  $\triangle ABC$  and  $\triangle BDE$  are equilateral triangles.

$$\therefore \angle ABC = \angle BDE = 60^\circ$$

$$\Rightarrow AB \parallel DE$$

[ $\because$  A pair of alternate interior angles is equal]

Now, as  $\triangle BED$  and  $\triangle AED$  are on the same base  $ED$  and between same parallels  $AB$  and  $DE$ .

$$\therefore ar(\triangle BED) = ar(\triangle AED)$$

Subtracting  $ar(\triangle EFD)$  from both sides, we get

$$\Rightarrow ar(\triangle BED) - ar(\triangle EFD) = ar(\triangle AED) - ar(\triangle EFD)$$

$$\Rightarrow ar(\triangle BFE) = ar(\triangle AFD)$$

(v) Since,  $ABC$  is an equilateral triangle, therefore  $AD$  will be perpendicular to  $BC$  also.

In right angled  $\triangle ABD$ , we have  $AD^2 = AB^2 - BD^2$

$$\Rightarrow AD^2 = a^2 - \frac{a^2}{4} = \frac{4a^2 - a^2}{4} = \frac{3a^2}{4} \Rightarrow AD = \frac{\sqrt{3}a}{2}$$

In right angled  $\triangle PED$ ,  $EP^2 = DE^2 - DP^2$

$$\Rightarrow EP^2 = \left(\frac{a}{2}\right)^2 - \left(\frac{a}{4}\right)^2 = \frac{a^2}{4} - \frac{a^2}{16} = \frac{3a^2}{16} \Rightarrow EP = \frac{\sqrt{3}a}{4}$$

$$\therefore ar(\triangle AFD) = \frac{1}{2} \times FD \times AD = \frac{1}{2} \times FD \times \frac{\sqrt{3}}{2} a \quad \dots(1)$$

$$\text{and } ar(\triangle FED) = \frac{1}{2} \times FD \times EP = \frac{1}{2} \times FD \times \frac{\sqrt{3}}{4} a \quad \dots(2)$$

From (1) and (2), we get  $ar(\triangle AFD) = 2 ar(\triangle FED)$

Also, we have  $ar(\triangle AFD) = ar(\triangle BFE)$

[From (iv) part]

$$\Rightarrow ar(\triangle BFE) = 2 ar(\triangle FED)$$

$$(vi) ar(\triangle AFC) = ar(\triangle AFD) + ar(\triangle ADC)$$

$$= ar(\triangle BFE) + \frac{1}{2} ar(\triangle ABC) \quad \text{[From (iv) part and } DE \text{ is the median of } \triangle ABC]$$

$$= ar(\triangle BFE) + \frac{1}{2} \times 4 \times ar(\triangle BDE) \quad \text{[From (i) part]}$$

$$= ar(\triangle BFE) + 2 ar(\triangle BDE)$$

$$= 2 ar(\triangle FED) + 2 [ar(\triangle BFE) + ar(\triangle FED)] \quad \text{[From (v) part]}$$

$$= 2 ar(\triangle FED) + 2 [2 ar(\triangle FED) + ar(\triangle FED)] \quad \text{[From (v) part]}$$

$$= 2 ar(\triangle FED) + 2 [3 ar(\triangle FED)]$$

$$= 2 ar(\triangle FED) + 6 ar(\triangle FED) = 8 ar(\triangle FED)$$

$$\therefore \frac{1}{8} ar(\triangle AFC) = ar(\triangle FED)$$

6. We have a quadrilateral  $ABCD$  such that its diagonals  $AC$  and  $BD$  intersect at  $P$ .

Draw  $AM \perp BD$  and  $CN \perp BD$ .

$$\text{Now, } ar(\triangle APB) = \frac{1}{2} \times BP \times AM$$

$$\text{and } ar(\triangle CPD) = \frac{1}{2} \times DP \times CN$$

$$\therefore ar(\triangle APB) \times ar(\triangle CPD) = \left(\frac{1}{2} \times BP \times AM\right) \times \left(\frac{1}{2} \times DP \times CN\right) \\ = \frac{1}{4} \times BP \times DP \times AM \times CN \quad \dots(i)$$

Similarly,  $ar(\triangle APD) \times ar(\triangle BPC)$

$$= \left(\frac{1}{2} \times DP \times AM\right) \times \left(\frac{1}{2} \times BP \times CN\right)$$

$$= \frac{1}{4} \times BP \times DP \times AM \times CN \quad \dots(ii)$$

From (i) and (ii), we get

$$ar(\triangle APB) \times ar(\triangle CPD) = ar(\triangle APD) \times ar(\triangle BPC)$$

7. We have, a  $\triangle ABC$  such that  $P$  is the mid-point of  $AB$  and  $Q$  is the mid-point of  $BC$ .

Also,  $R$  is the mid-point of  $AP$ .

Join  $AQ$  and  $PC$ .

(i) In  $\triangle APQ$ ,  $R$  is the mid-point of  $AP$ . [Given]  
 $\therefore RQ$  is a median of  $\triangle APQ$ .

$$\text{So, } ar(\triangle PRQ) = \frac{1}{2} ar(\triangle APQ) \quad \dots(1)$$

In  $\triangle ABQ$ ,  $P$  is the mid-point of  $AB$ .

$\therefore QP$  is a median of  $\triangle ABQ$ .

$$\text{So, } ar(\triangle APQ) = \frac{1}{2} ar(\triangle ABQ) \quad \dots(2)$$

From (1) and (2), we get

$$\begin{aligned} ar(\triangle PRQ) &= \frac{1}{2} \times \frac{1}{2} ar(\triangle ABQ) \\ &= \frac{1}{4} ar(\triangle ABQ) = \frac{1}{4} \times \frac{1}{2} ar(\triangle ABC) \\ & \quad [\because AQ \text{ is a median of } \triangle ABC] \\ &= \frac{1}{8} ar(\triangle ABC) \quad \dots(3) \end{aligned}$$

$$\begin{aligned} \text{Now, } ar(\triangle ARC) &= \frac{1}{2} ar(\triangle APC) \\ & \quad [\because CR \text{ is a median of } \triangle APC] \\ &= \frac{1}{2} \times \frac{1}{2} ar(\triangle ABC) \quad [\because CP \text{ is a median of } \triangle ABC] \\ &= \frac{1}{4} (ar \triangle ABC) \quad \dots(4) \end{aligned}$$

From (3) and (4), we get

$$ar(\triangle PRQ) = \frac{1}{8} ar(\triangle ABC) = \frac{1}{2} \times \left( \frac{1}{4} ar \triangle ABC \right) = \frac{1}{2} ar(\triangle ARC)$$

$$\text{Thus, } ar(\triangle PRQ) = \frac{1}{2} ar(\triangle ARC)$$

(ii) In  $\triangle RBC$ ,  $RQ$  is a median.

$$\begin{aligned} \therefore ar(\triangle RQC) &= ar(\triangle RBQ) = ar(\triangle PRQ) + ar(\triangle BPQ) \\ &= \frac{1}{8} ar(\triangle ABC) + ar(\triangle BPQ) \quad [\text{From (3)}] \\ &= \frac{1}{8} ar(\triangle ABC) + \frac{1}{2} ar(\triangle PBC) \\ & \quad [\because PQ \text{ is the median of } \triangle BPC] \\ &= \frac{1}{8} ar(\triangle ABC) + \frac{1}{2} \left( \frac{1}{2} ar(\triangle ABC) \right) \\ & \quad [\because CP \text{ is the median of } \triangle ABC] \\ &= \frac{1}{8} ar(\triangle ABC) + \frac{1}{4} ar(\triangle ABC) \\ &= \left( \frac{1}{8} + \frac{1}{4} \right) ar(\triangle ABC) = \frac{3}{8} ar(\triangle ABC) \end{aligned}$$

(iii)  $QP$  is a median of  $\triangle ABQ$ .

$$\begin{aligned} \therefore ar(\triangle PBQ) &= \frac{1}{2} (ar \triangle ABQ) = \frac{1}{2} \times \frac{1}{2} ar(\triangle ABC) \\ & \quad [\because AQ \text{ is the median of } \triangle ABC] \\ &= \frac{1}{4} ar(\triangle ABC) = ar(\triangle ARC) \quad [\text{From (4)}] \end{aligned}$$

$$\text{Thus, } ar(\triangle PBQ) = ar(\triangle ARC)$$

8. We have, a right  $\triangle ABC$  such that  $BCED$ ,  $ACFG$  and  $ABMN$  are squares on its sides  $BC$ ,  $CA$  and  $AB$  respectively. Also, line segment  $AX \perp DE$  is drawn such that it meets  $BC$  at  $Y$ .

(i) In  $\triangle ABD$  and  $\triangle MBC$ , we have  
 $AB = MB$  } [Sides of a square]  
 $BD = BC$  }  
 $\angle CBD = \angle MBA$  [Each  $90^\circ$ ]  
 $\Rightarrow \angle CBD + \angle ABC = \angle MBA + \angle ABC$   
 [By adding  $\angle ABC$  on both sides]

$\Rightarrow \angle ABD = \angle MBC$   
 $\therefore \triangle ABD \cong \triangle MBC$  [By SAS congruency criterion]

(ii) Since,  $AX \perp DE$  therefore  $AX \parallel BD$  and  $AX \parallel CE$ .

Thus,  $BYXD$  and  $CYXE$  both are parallelograms.

Now, as parallelogram  $BYXD$  and  $\triangle ABD$  are on the same base  $BD$  and between the same parallels  $BD$  and  $AX$ .

$$\therefore ar(\triangle ABD) = \frac{1}{2} ar(\parallel^{\text{gm}} BYXD)$$

But  $ar(\triangle ABD) = ar(\triangle MBC)$  [Congruent triangles have equal areas]

$$\Rightarrow ar(\triangle MBC) = \frac{1}{2} ar(\parallel^{\text{gm}} BYXD)$$

$$\Rightarrow ar(\parallel^{\text{gm}} BYXD) = 2ar(\triangle MBC) \quad \dots(1)$$

(iii) Since,  $ar(BYXD) = 2ar(\triangle MBC)$  [From (ii) part]

Also,  $ar(\text{square } ABMN) = 2ar(\triangle MBC)$  [From (ii) part]  
 $[\because \parallel^{\text{gm}} ABMN$  and  $\triangle MBC$  are on the same base  $MB$  and between the same parallels  $MB$  and  $NC]$

From (1) and (2), we have

$ar(BYXD) = ar(ABMN)$   
 (iv) In  $\triangle FCB$  and  $\triangle ACE$ , we have  
 $FC = AC$  [Sides of a square]  
 $CB = CE$  [Sides of a square]  
 $\angle FCA = \angle BCE$  [Each  $90^\circ$ ]  
 $\Rightarrow \angle FCA + \angle ACB = \angle BCE + \angle ACB$   
 [By adding  $\angle ACB$  on both sides.]

$\Rightarrow \angle FCB = \angle ACE$   
 $\therefore \triangle FCB \cong \triangle ACE$  [By SAS congruency criterion]

(v) Since  $\parallel^{\text{gm}} CYXE$  and  $\triangle ACE$  are on the same base  $CE$  and between the same parallels  $CE$  and  $AX$ .

$$\therefore ar(\parallel^{\text{gm}} CYXE) = 2ar(\triangle ACE)$$

But  $\triangle ACE \cong \triangle FCB$  [From (iv) part]

$$\therefore ar(\triangle ACE) = ar(\triangle FCB) \quad [\because \text{Congruent triangles are equal in area.}]$$

$$\therefore ar(\parallel^{\text{gm}} CYXE) = 2ar(\triangle FCB)$$

(vi) Since,  $ar(\parallel^{\text{gm}} CYXE) = 2ar(\triangle FCB)$  [From (v) part]  
 $\dots(3)$

Also, ( $\parallel^{\text{gm}} ACFG$ ) and  $\triangle FCB$  are on the same base  $FC$  and between the same parallels  $FC$  and  $BG$ .

$$\therefore ar(\parallel^{\text{gm}} ACFG) = 2ar(\triangle FCB) \quad \dots(4)$$

From (3) and (4), we get

$$ar(\parallel^{\text{gm}} CYXE) = ar(\parallel^{\text{gm}} ACFG) \quad \dots(5)$$

$$\begin{aligned} \text{(vii) Now, } ar(\parallel^{\text{gm}} BCED) &= ar(\parallel^{\text{gm}} CYXE) + ar(\parallel^{\text{gm}} BYXD) \\ &= ar(\parallel^{\text{gm}} ACFG) + ar(\parallel^{\text{gm}} ABMN) \end{aligned}$$

[From (iii), (vi) parts]  
 Thus,  $ar(\parallel^{\text{gm}} BCED) = ar(\parallel^{\text{gm}} ABMN) + ar(\parallel^{\text{gm}} ACFG)$
